User presses the start button without altering any of the values given in the edit boxes.

Result: The simulators text box, throughout the simulation, fills with text relating to the simulation of the car park. The final pieces of text in the text box display indicate that total number of cars involved in the simulation was 1069, no vehicles remain in the car park, 168 vehicles were disappointed and there are no vehicles remain in the queue. Both graphs display the correct information generated by the simulation.

User halves the maximum car, small car and motorcycle spaces and then starts the simulation.

Result: The simulators text box, throughout the simulation, fills with text relating to the simulation of the car park. The final pieces of text in the text box display indicate that total number of cars involved in the simulation was 1073, no vehicles remain in the car park, 569 vehicles were disappointed and there are no vehicles remain in the queue. Both graphs display the correct information generated by the simulation.

Again Reset Display Graph Normal Graph	

User removes all of the default values in the edit boxes and starts the simulation.

Result: The simulators text box fills with error messages telling the user the requirements for each field. The simulation does not run, the text box and both graphs remain empty of data from the simulation.

User runs the simulation. Once the simulation is complete the user clicks both of the graph buttons.

Result: The simulators runs through the first simulation giving the same results as the first test. Upon the user clicking either of the graph buttons the GUI changes to show the graph corresponding to what button they pressed.

User runs the simulation. Upon completing the simulation the user resets the simulator, adds new values in the edit boxes and starts a second simulation.

Result: The simulators runs through the first simulation giving the same results as the first test. Upon pressing the reset button all data from the previous simulation is removed from the text box and the graphs. The second simulation is then run with the different values in edit boxes. The result given in the text box and the graph is correct and different from the first run through of the simulator.

User starts the simulation and presses the graph buttons during the simulation.

Result: As the simulation runs, both the graphs are gradually filled with data throughout the simulation even when switching back and forth between each graph. The simulators text box still fills with text relating to the simulation of the car park and both graphs display the correct data at the end of the simulation.
